## Folder 5 Metadata & Registry

---

| Registry Parameter | Value Specification                                                       |
|--------------------|---------------------------------------------------------------------------|
| Development Phase  | Folder 5 – Dashboard Construction (Workbook Building)                     |
| Technical Focus    | Tableau Worksheet Assembly, Calculated Field Logic, Interactive Filtering |
| Status             | Validated - Final Interactive Visuals Constructed                         |

### 1. Construction Phase Executive Summary

---

This phase marks the transition from static design blueprints into functional, interactive dashboards. Utilizing the sanitized datasets from Folder 4 and the wireframe layouts from Folder 3, we build the core analytical views within the Tableau environment to solve identified student dietary challenges.

### 2. Tableau Worksheet Development

---

The following interactive views were constructed to fulfill the analytical objectives:

| Worksheet Name          | Primary Function                                                                       |
|-------------------------|----------------------------------------------------------------------------------------|
| Cohort Summary          | KPI cards tracking aggregate intake data and average population health metrics.        |
| Stress Correlation View | Scatter plots illustrating the link between academic strain and unhealthy food intake. |
| Budget Impact Grid      | Comparative view highlighting how financial constraints influence meal choices.        |

### 3. Calculated Field Implementation

---

Core logical formulas integrated into the workbook to drive real-time data filtering:

- **Dietary Quality Index:** formula measuring processed food intake ratios.

- **Stress Score Adjustment:** calculated field to normalize stress values across surveyed student groups.

## 4. Folder 5 Development Conclusion

---

The construction phase successfully bridges the gap between data logic and user engagement. The dashboard is now fully functional, allowing real-time cross-filtering of student health trends, providing clear insights for wellness program interventions.
